GCSE COMPUTER SCIENCE

Paper 1 Computational thinking and programming skills – Python

Friday 19 May 2023

Afternoon

Materials

- There are no additional materials required for this paper.
- You must **not** use a calculator.

Instructions

- Use black ink or black ball-point pen. Use pencil only for drawing.
- Answer **all** questions.
- You must answer the questions in the spaces provided.
- If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- Do all rough work in this book. Cross through any work you do not want to be marked.
- Questions that require a coded solution must be answered in Python.
- You should assume that all indexing in code starts at 0 unless stated otherwise.

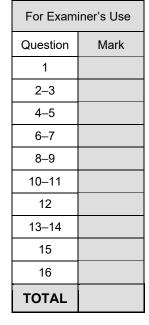

Information

The total number of marks available for this paper is 90.

Advice

| For the multiple-choice questions, completely fill in the lozenge alongside the appropriate answer. |
|-------------------------------------------------------------------------------------------------------------|
| CORRECT METHOD WRONG METHODS 🕉 💿 🚔 🗹 |
| If you want to change your answer you must cross out your original answer as shown. 🛛 🕅 |
| If you wish to return to an answer previously crossed out, ring the answer you now wish to select as shown. |

Figure 8 shows an algorithm, written using pseudo-code, that uses a RECORD data structure for storing information about a film.

Each record stores four pieces of information about a film:

• film title

09

- certificate (eg 12A, PG)
- year the film was made
- if the film is currently being shown at a cinema.

There are records for three films and these films are stored alphabetically in an array called filmCollection.

The pseudo-code outputs the title of the newest of the three films.

• Part of the algorithm has been replaced by the label 11.

Figure 8

```
RECORD Film
 title : String
 certificate : String
 year : Integer
 beingShown : Boolean
ENDRECORD
year \leftarrow 0
position \leftarrow 0
FOR i \leftarrow 0 TO L1
  IF filmCollection[i].year > year THEN
   position \leftarrow i
 ENDIF
ENDFOR
OUTPUT filmCollection[position].title, ' is the
newest film'

1 3

A programmer is writing a game. The game uses a 3 x 3 grid containing nine squares.

In the game, a square on the grid is referred to by a letter and a number. For example, square C3 in **Figure 14** contains an X.

Figure 15 shows part of a Python program that checks the grid reference entered by a player.

The grid reference is valid if:

- there are exactly two characters
- the first character entered is A, B or C
- the second character entered is 1, 2 or 3.

Figure 15

```
check = False
while check == False:
    square = ""
    while len(square) != 2:
        square = input("Enter grid reference (eg C2): ")
        square = square.upper()
```

The Python function <code>upper()</code> converts letters into uppercase, eg <code>b1</code> would be converted to <code>B1</code>

Extend the program from **Figure 15** so it completes the other checks needed to make sure a valid grid reference is entered.

Your extended program must:

- use the variable check
- repeat the following steps until a valid grid reference is entered:
 - o get the user to enter a grid reference
 - $\circ\,$ output an appropriate message if the grid reference entered is not valid.

You **should** use indentation as appropriate, meaningful variable name(s) and Python syntax in your answer.

The answer grid contains vertical lines to help you indent your code.

A group of people have a meal in a restaurant. Instead of one person paying for the whole meal, each person will pay for what they eat.

Write a Python program that asks each person in the group how much they are paying towards the meal and works out when the bill is fully paid. Each person can pay a different amount.

The program should:

1 5

- get the user to enter the total amount of the bill
- get a person to enter how much they are paying towards the bill
- subtract the amount entered from the bill:
 - $\circ\,$ if the amount left to pay is more than 0, output how much is left to pay and repeat until the amount left to pay is 0 or less
 - \circ if the amount left to pay is 0, then output the message <code>Bill paid</code>
 - $\circ\,$ if the amount left to pay is less than 0, then output the message <code>Tip is</code> and the difference between the amount left to pay and 0

You **should** use indentation as appropriate, meaningful variable name(s) and Python syntax in your answer.

The answer grid below contains vertical lines to help you indent your code.

Question **16** is about a dice game played against a computer.

The aim of the game is to get as close to a score of 21 as you can, without going over 21. If your score goes over 21 then you lose.

The player's score starts at 0.

For each turn:

1 6

- two dice (each numbered from 1 to 6) are rolled
- the total of the two dice rolls is added to the player's score
- the value of each dice and the player's new total is output
- if the current score is less than 21, the player is asked if they would like to roll the dice again: if the player says yes, they get another turn; otherwise, the game ends.

At the end of the game, the program should work as follows:

- if the final score is 21, output a message to say the player has won
- if the final score is greater than 21, output a message to say the player has lost
- if the final score is less than 21, the program generates a random number between 15 and 21 inclusive:
 - $_{\odot}\,$ if this random number is greater than the player's final score, output a message to say the player has lost
 - o otherwise, output a message to say the player has won.

Figure 17 shows the output of a program that plays this dice game.

Figure 17

Roll 1: 1 Roll 2: 4 Current score: 5 Would you like to roll again? yes Roll 1: 1 Roll 2: 6 Current score: 12 Would you like to roll again? yes Roll 1: 1 Roll 2: 2 Current score: 15 Would you like to roll again? yes Roll 1: 6 Roll 2: 1 Current score: 22 You lost!

Write a Python program to simulate this game.

The first line has been written for you in the answer grid.

Do not write outside the The dice rolls are carried out by the program generating random numbers between 1 and 6. You will need to use the Python function random.randrange(a, b) which generates a random integer in the range a to b starting at a but finishing one before b. You should use indentation as appropriate, meaningful variable name(s) and Python syntax in your answer. The answer grid below contains vertical lines to help you indent your code.
