GCSE **COMPUTER SCIENCE**

Paper 1 Computational thinking and programming skills – VB.Net

Materials

- There are no additional materials required for this paper.
- You must not use a calculator.

Instructions

- Use black ink or black ball-point pen. Use pencil only for drawing.
- Answer all questions.
- You must answer the questions in the spaces provided.
- If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- Do all rough work in this book. Cross through any work you do not want to be marked.
- Questions that require a coded solution must be answered in VB.Net.
- You should assume that all indexing in code starts at 0 unless stated otherwise.

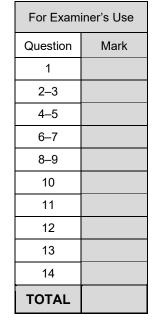

Information

The total number of marks available for this paper is 90.

J U N 2 2 8 5 2 5 1

Advice

For the multiple-choice questions, completely fill in the lozenge alongside the appropriate answer.
CORRECT METHOD WRONG METHODS 😵 💿 🚔 🗹
If you want to change your answer you must cross out your original answer as shown. 🛛 📉
If you wish to return to an answer previously crossed out, ring the answer you now wish to select as shown.

Time allowed: 2 hours

10.4 A REPEAT...UNTIL iteration structure was used in Figure 9.

Figure 9 has been included again below.

Figure 9

```
SUBROUTINE calculate(n)

a \leftarrow n

b \leftarrow 0

REPEAT

a \leftarrow a DIV 2

b \leftarrow b + 1

UNTIL a \leq 1

OUTPUT b

ENDSUBROUTINE
```

Figure 10 shows another subroutine called calculate that uses a WHILE...ENDWHILE iteration structure.

Figure 10

```
SUBROUTINE calculate(n)

a \leftarrow n

b \leftarrow 0

WHILE a > 1

a \leftarrow a DIV 2

b \leftarrow b + 1

ENDWHILE

OUTPUT b

ENDSUBROUTINE
```

One difference in the way the subroutines in Figure 9 and Figure 10 work is:

- the REPEAT...UNTIL iteration structure in Figure 9 loops until the condition is true
- the WHILE...ENDWHILE iteration structure in Figure 10 loops until the condition is false.

Describe two other differences in the way the subroutines in Figure 9 and Figure 10	Do not write outside the box

11. **1** The size of a sound file is calculated using the following formula:

size (in bits) = sampling rate * sample resolution * seconds

To calculate the size in bytes, the number is divided by 8

The algorithm in **Figure 12**, represented using pseudo-code, should output the size of a sound file in **bytes** that has been sampled 100 times per second, with a sample resolution of 16 bits and a recording length of 60 seconds.

A subroutine called getSize has been developed as part of the algorithm.

Complete Figure 12 by filling in the gaps using the items in Figure 11.

You will not need to use all the items in Figure 11.

Find Personal Tutor from www.wisesprout.co.uk

Do not write outside the box

1 3	A program is being developed in VB.Net to simulate a card game.
	Throughout the game each player always has 100 cards. Each card displays a number.
	Players take it in turns to swap one of their cards with another random card from a set of cards until a player has a run of five numbers in sequence within their 100 cards.
1 3.1	Figure 14 shows part of the program that will get a player to enter the position of a card to swap.
	Figure 14
	Console.Write("Enter card position: ")
	<pre>Dim position As Integer = Console.ReadLine()</pre>
	Extend the program in Figure 14 . Your answer must be written in VB.Net.
	The program should keep getting the user to enter the card position until they enter a card position that is between 1 and 100 inclusive.
	You should use meaningful variable name(s) and VB.Net syntax in your answer.
	The answer grid below contains vertical lines to help you indent your code. [4 marks]
	Question 13 continues on the next page

1 3.2

There are 500 cards within the game in total. Each card is numbered from 1 to 250 and each number appears twice in the whole set of cards.

The player's 100 cards are always stored in numerical order.

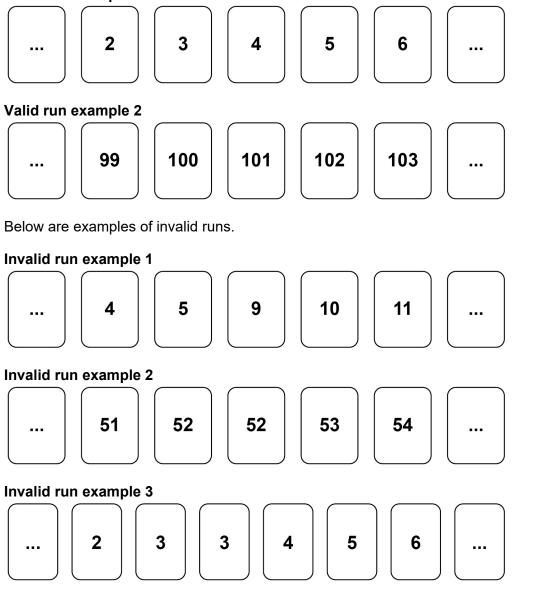

When a player has a valid run of five cards within their 100 cards they have won the game.

A valid run:

- consists of five cards
- can start from any position in the player's 100 cards
- the second card's value is one more than the first card's value, the third card's value is one more than the second card's value, the fourth card's value is one more than the third card's value, and the fifth card's value is one more than the fourth card's value.

Below are examples of valid runs which means a player has won.

Write a VB.Net program to check if a player has a valid run of five cards within their 100 cards.

When writing your program you should assume:

- there is an array called cards that contains the values of the player's 100 cards
- cards (0) will contain the value of the first card and cards (99) will contain the value of the last card
- the values in ${\tt cards}$ are already stored in numerical order
- there is a Boolean variable called gameWon that has a value of False.

Your program should set gameWon to True if there is a valid run.

You **should** use meaningful variable name(s) and VB.Net syntax in your answer.

The answer grid below contains vertical lines to help you indent your code.

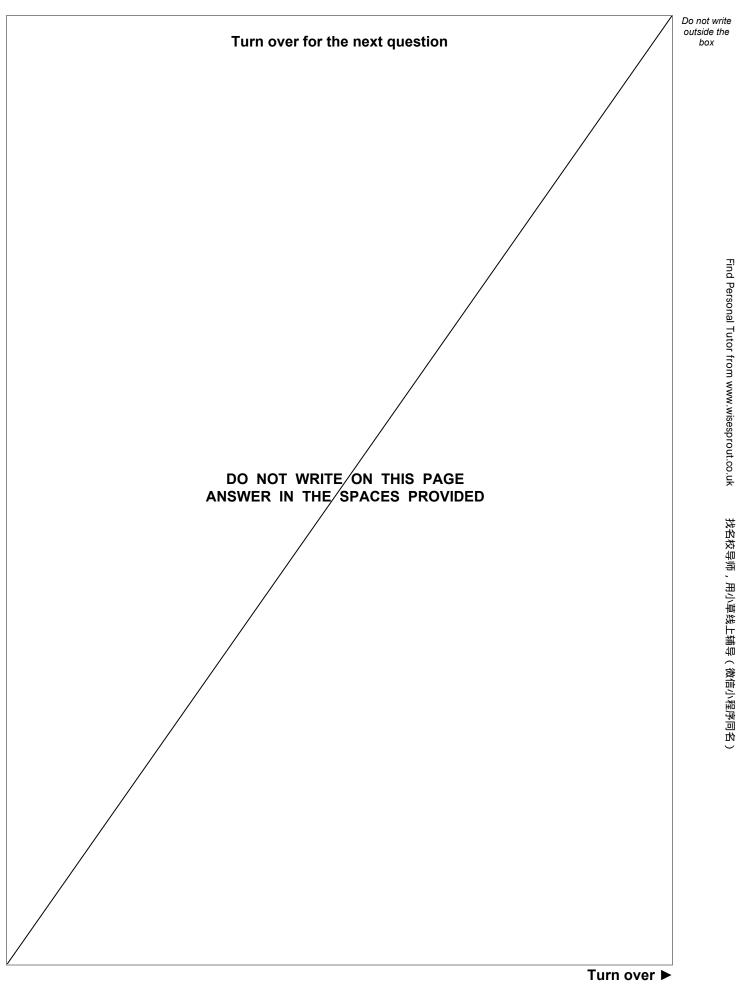

[6 marks]

Question 13 continues on the next page

Do not write outside the box

. .

A program is being written to simulate a computer science revision game in the style of bingo.

34

At the beginning of the game a bingo ticket is generated with nine different key terms from computer science in a 3×3 grid. An example bingo ticket is provided in **Figure 15**.

Figure 15

CPU	ALU	Pixel
NOT gate	Binary	LAN
Register	Cache	Protocol

The player will then be prompted to answer a series of questions.

If an answer matches a key term on the player's bingo ticket, then the key term will be marked off automatically.

1 4

Do not write outside the box	Ire 16 shows an incomplete VB.Net program to create a bingo ticket for a player.	1 4 . 1 Figu								
	The programmer has used a two-dimensional array called ticket to represent a bingo ticket. The program uses a subroutine called generateKeyTerm. When called, the subroutine will return a random key term, eg "CPU", "ALU", "NOT gate" etc.

1 4 . 2

Each time a player answers a question correctly the ticket array is updated; if their answer is in the ticket array then it is replaced with an asterisk (*).

An example of the ticket array containing key terms and asterisks is shown in **Figure 17**.

	0	1	2
0	CPU	ALU	*
1	*	*	LAN
2	Register	Cache	*

Write a subroutine in VB.Net called checkWinner that will count the number of asterisks.

The subroutine should:

- take the ticket array as a parameter
- count the number of asterisks in the ${\tt ticket}$ array
- output the word Bingo if there are nine asterisks in the array
- output the total number of asterisks if there are fewer than nine asterisks in the array.

You **must** write your own count routine and not use any built-in count function that might be available in VB.Net.

You **should** use meaningful variable name(s) and VB.Net syntax in your answer.

The answer grid below contains vertical lines to help you indent your code.
