

Oxford Cambridge and RSA

**Thursday 25 May 2023 – Afternoon**

**GCSE (9–1) Computer Science**

**J277/02** Computational thinking, algorithms and programming

**Time allowed: 1 hour 30 minutes**

**Do not use:**

- a calculator

Please write clearly in black ink. **Do not write in the barcodes.**

### INSTRUCTIONS

- Use black ink.
- Write your answer to each question in the space provided. If you need extra space use the lined pages at the end of this booklet. The question numbers must be clearly shown.
- Answer **all** the questions.

### INFORMATION

- The total mark for this paper is **80**.
- The marks for each question are shown in brackets [ ].
- This document has **20** pages.

### ADVICE

- Read each question carefully before you start your answer.

**2**  
**SECTION A**

- 1 (a)** The table contains four statements about programming languages.

Tick (✓) **one** box in each row to identify whether each statement describes a low-level programming language or a high-level programming language.

| Statement                                                              | Low-level | High-level |
|------------------------------------------------------------------------|-----------|------------|
| The same language can be used on computers that use different hardware |           |            |
| It allows the user to directly manipulate memory                       |           |            |
| It allows the user to write English-like words                         |           |            |
| It always needs to be translated into object code or machine code      |           |            |

[4]

- (b)** The variables `num1` and `num2` store integers.

Write pseudocode to add the integers stored in `num1` and `num2`. Store the result in a variable with the identifier `total`

.....  
..... [1]

- (c)** Three incomplete pseudocode algorithms are given with a description of the purpose of each algorithm.

Write the missing arithmetic operator for each algorithm.

- (i)** Outputting 12 to the power of 2.

`print(12 ..... 2)` [1]

- (ii)** Working out if a number is odd or even.

```
number = 53
if number ..... 2 == 0 then
    print("Even number")
else
    print("Odd number")
endif
```

 [1]

(iii) Finding the difference between two measurements.

```
measurement1 = 300
```

```
measurement2 = 100
```

```
difference = measurement1 ..... measurement2
```

[1]

(d) Read the following pseudocode algorithm:

```
01 start = 3
02 do
03   print(start)
04   start = start - 1
05 until start == -1
06 print("Finished")
```

Complete the following trace table for the given algorithm.

| Line number | start | Output |
|-------------|-------|--------|
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |
|             |       |        |

[3]

Turn over

- 2 This pseudocode algorithm totals all the numbers in the 0-indexed array `scores`

```

01 total = 0
02 for scoreCount = 1 to scores.length - 1
03     scores[scoreCount] = total + total
04 next scoreCount
05 print(total)

```

The function `length` returns the number of elements in the array.

The algorithm contains several errors.

Two types of errors in a program are syntax and logic errors.

- (a) State what is meant by a syntax error and a logic error.

Syntax error .....

.....

Logic error .....

.....

**[2]**

- (b) Identify **two** logic errors in the pseudocode algorithm.

Write the refined line to correct each error.

Error 1 line number .....

Corrected line .....

.....

.....

Error 2 line number .....

Corrected line .....

.....

.....

**[4]**

### 3 An insertion sort is one type of sorting algorithm.

A student has written a pseudocode algorithm to perform an insertion sort on a 1D array `names`.

```
names = ["Kareem", "Sarah", "Zac", "Sundip", "Anika"]
for count = 1 to names.length - 1
    pos = count
    while (pos > 0 and names[pos] < names[pos - 1])
        temp = names[pos]
        names[pos] = names[pos - 1]
        names[pos - 1] = temp
        pos = pos - 1
    endwhile
next count
```

(a) Describe the purpose of the variable `temp` in the insertion sort pseudocode algorithm.

.....

.....

.....

..... [2]

(b) An insertion sort contains a nested loop; a loop within a loop. In this pseudocode algorithm the outer loop is a count-controlled loop and the inner loop is a condition-controlled loop.

Explain why the inner loop needs to be a condition-controlled loop.

.....

.....

.....

..... [2]

(c) A bubble sort is another type of sorting algorithm.

(i) Describe **one** difference between an insertion sort and a bubble sort.

.....

.....

.....

..... [2]

(ii) Describe **two** similarities between an insertion sort and a bubble sort.

1 .....

.....

2 .....

.....

[2]

- 4 A garden floodlight system uses inputs from sensors and switches to decide whether it should be turned on.

The table shows the inputs into the system and the meaning of each input value:

| Letter | Input device  | Input of 1                          | Input of 0                            |
|--------|---------------|-------------------------------------|---------------------------------------|
| A      | Motion sensor | Motion is detected                  | Motion is not detected                |
| B      | Light sensor  | Light levels indicate it is daytime | Light levels indicate it is nighttime |
| C      | Light switch  | The switch is turned on             | The switch is turned off              |

The floodlight (Q) is designed to be on ( $Q = 1$ ) when the switch is turned on and the motion sensor detects motion at nighttime.

- (a) Draw a logic diagram for the floodlight.

[3]

(b) Identify the logic gates for truth table 1 and truth table 2.

Truth table 1:

| A | B | Output |
|---|---|--------|
| 0 | 0 | 0      |
| 0 | 1 | 1      |
| 1 | 0 | 1      |
| 1 | 1 | 1      |

Logic gate 1: .....

Truth table 2:

| A | B | Output |
|---|---|--------|
| 0 | 0 | 0      |
| 0 | 1 | 0      |
| 1 | 0 | 0      |
| 1 | 1 | 1      |

Logic gate 2: .....

[2]

5 Charlie is developing an adding game. The rules of the game are:

- the player is asked 3 addition questions
- each question asks the player to add together two random whole numbers between 1 and 10 inclusive
- if the player gets the correct answer, 1 is added to their score
- at the end of the game their score is displayed.

(a) Charlie has been told that the game will need to be tested before giving it to the players.

(i) Explain why programs should be tested before use.

.....

.....

.....

..... [2]

(ii) Complete the table by naming and describing **one** type of test that should be used on Charlie's program before releasing it.

| Test type | Description |
|-----------|-------------|
|           |             |

[2]

(iii) Complete the table by identifying **and** describing **two** features of an IDE that can be used when testing a program.

| Feature | Description |
|---------|-------------|
|         |             |
|         |             |

[4]

(b) Validating inputs can reduce errors when a program is being run.

Identify **two** methods of validation **and** explain how they can be used on this game.

Validation method 1 .....

Use .....

.....

.....

.....

Validation method 2 .....

Use .....

.....

.....

.....

[6]

**(c)** Write an algorithm to play this game. The rules are repeated from the start of the question here:

- the player is asked 3 addition questions
- each question asks the player to add together two random whole numbers between 1 and 10 inclusive
- if the player gets the correct answer, 1 is added to their score
- at the end of the game their score is displayed.

[6]

## SECTION B

**We advise you to spend at least 40 minutes on this section.**

**Some questions require you to respond using either the OCR Exam Reference Language or a high-level programming language you have studied. These are clearly shown.**

- 6** OCR Security Services is a company that installs intruder alarm systems in commercial buildings.

The systems use a computer that is connected to the door sensors and window sensors.

The following data is stored in the system:

| Data stored                                                                             | Variable identifier  | Example data  |
|-----------------------------------------------------------------------------------------|----------------------|---------------|
| The user's name                                                                         | UserName             | Admin123      |
| A telephone number to call when the alarm is activated                                  | EmergencyPhoneNumber | +449999999999 |
| Whether a door sensor is activated                                                      | DoorSensorActive     | True          |
| Whether a window sensor is activated                                                    | WindowSensorActive   | True          |
| A timer that counts, to the nearest second, how long a door sensor has been activated   | DoorActiveTime       | 100           |
| A timer that counts, to the nearest second, how long a window sensor has been activated | WindowActiveTime     | 100           |
| Whether the system is armed                                                             | SystemArmed          | True          |
| Whether the system is in test mode                                                      | TestModeActive       | True          |

(a) Below is a table showing some variables within the program.

Tick (✓) **one** box in each row to identify the most appropriate data type for each variable.

| Variable             | Boolean | Char | String | Integer | Real |
|----------------------|---------|------|--------|---------|------|
| UserName             |         |      |        |         |      |
| EmergencyPhoneNumber |         |      |        |         |      |
| DoorSensorActive     |         |      |        |         |      |
| DoorActiveTime       |         |      |        |         |      |

[4]

(b) The alarm has an algorithm that decides whether to sound the alarm by checking the data that is stored in the following three variables.

- SystemArmed
- DoorSensorActive
- WindowSensorActive

The alarm will only sound when the alarm has been activated **and** one or both of the door and window sensors are activated. When the system needs to sound the alarm it calls the pre-written procedure `SoundAlarm()`

Write a program that checks the data in the variables and calls `SoundAlarm()` when appropriate.

You must use **either**:

- OCR Exam Reference Language, **or**
- A high-level programming language that you have studied.

.....

.....

.....

.....

.....

..... [4]

- (c) The alarm system can also have motion sensors. Each type of sensor has a code. The code for each sensor is given in the table:

| Code | Sensor        |
|------|---------------|
| MS   | Motion sensor |
| DS   | Door sensor   |
| WS   | Window sensor |

A program is written to reset the sensors. The program:

- asks the user to enter the code for the sensor they want to reset
- calls the prewritten function `CheckSensorCode()` to check whether the code entered is a valid code
- the sensor number is read as input if the code is valid and the function `ResetSensor()` is called for the sensor

```

01  sensorType = input("Enter code of the type of sensor to reset")
02  if(CheckSensorCode(sensorType)) then
03      sensorNumber = input("Please input the number of the sensor
                             to reset")
04      sensorID = sensorType + sensorNumber
05      ResetSensor(sensorID)
06  endif

```

- (i) Give the line number where there is concatenation.

..... [1]

- (ii) Give the identifier of a variable used in the program.

..... [1]

- (iii) Identify the data type of the data returned by the function `CheckSensorCode()`

..... [1]

- (iv) Give the line number that contains a function call.

..... [1]

- (v) Identify **two** programming constructs that have been used in the program.

1 .....

2 .....

[2]

- (d) The alarm system has a log that stores a record each time a sensor is triggered. This is called an event. The record format is given in the table:

| Fieldname  | Description                                                            |
|------------|------------------------------------------------------------------------|
| Date       | The date the event happened                                            |
| SensorID   | The sensor that was activated                                          |
| SensorType | The type of sensor that was activated – Door, Motion or Window         |
| Length     | The number of seconds the sensor was triggered (to the nearest second) |

The log is stored in a database table called `events`. The current contents of `events` is shown:

| Date       | SensorID | SensorType | Length |
|------------|----------|------------|--------|
| 05/02/2023 | WS2      | Window     | 38     |
| 05/02/2023 | MS1      | Motion     | 2      |
| 06/02/2023 | DS3      | Door       | 1      |
| 06/02/2023 | MS2      | Motion     | 3      |
| 06/02/2023 | MS1      | Motion     | 2      |
| 07/02/2023 | WS1      | Window     | 24     |
| 07/02/2023 | DS1      | Door       | 1      |

Write an SQL statement to display the sensor IDs of the door sensors that have been triggered for more than 20 seconds.

.....

.....

.....

.....

.....

..... [3]

- (e) A program written in a high-level language is used to access the data from the database. This program has a procedure, `SaveLogs ()`, that stores the data to an external text file.

The procedure `SaveLogs ()`:

- takes the string of data to be stored to the text file as a parameter
- takes the filename of the text file as a parameter
- stores the string of data to the text file.

Write the procedure `SaveLogs()`

You must use **either**:

- OCR Exam Reference Language, **or**
- A high-level programming language that you have studied.

[6]

- (f) OCR Security Services need to identify the total number of seconds the sensors have been activated on a specific date.

The data from the database table `events` is imported into the program written in a high-level programming language.

The program stores the data in a two-dimensional (2D) string array with the identifier `arrayEvents`

The data to be stored is shown in the table.

| Date       | SensorID | SensorType | Length |
|------------|----------|------------|--------|
| 05/02/2023 | WS2      | Window     | 38     |
| 05/02/2023 | MS1      | Motion     | 2      |
| 06/02/2023 | DS3      | Door       | 1      |
| 06/02/2023 | MS2      | Motion     | 3      |
| 06/02/2023 | MS1      | Motion     | 2      |
| 07/02/2023 | WS1      | Window     | 24     |
| 07/02/2023 | DS1      | Door       | 1      |

In this table, the value of `events[1, 1]` contains "MS1".

- (i) An array can only store data of one data type. Any non-string data must be converted to a string before storing in the array.

Identify the process that converts integer data to string data.

..... [1]

This image shows a full page of primary-ruled paper. It features a vertical solid line on the left side, creating a narrow margin. The rest of the page is filled with horizontal dashed lines, providing a guide for letter height in handwriting practice. There are no markings or text on the page.
